

BCL Technologies offers **Server Solutions** to meet high volume processing needs. These solutions range from watch folder processes to complete document processing systems.

Workflow Server solutions provide users with systems that can streamline administrative, departmental, project and enterprise-wide document processing goals. BCL Workflow Servers utilize directory and folder protocols (Folder Watchers) to streamline the process of converting files on demand. You simply select the documents you wish to process and place it in a specified file directory on a BCL Workflow Server. The system will automatically and instantly processes those files. Workflow solutions are available for easyPDF, Freebird, Drake, and Magellan.

BCL FileShare allows users to view their documents on a variety of display devices while preserving the content, regardless of the display medium. The application enables users to upload documents to the server, automatically add them to a document collection, index and catalog, then publish in HTML and share any type of document in a secure environment with any internet-enabled device. Once the documents are uploaded to FileShare Server, workgroup members can view the documents either in its native format or in HTML. Group members can check out documents, comment on them, modify them, and check them back in. BCL FileShare Server automatically backs up the previous version and keeps track of the new author, thus allowing tracking and roll back of changes. Users can save documents in different categories and search and retrieve documents by content.
